Sequence 1, Application US/10127890 Publication No. US20030166196A1 GENERAL INFORMATION:

APPLICANT: Better, Marc D.

Carroll, Stephen F.

Studnika, Gary M.

FITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating Proteins

NUMBER OF SEQUENCES: 173

CORRESPONDENCE ADDRESS:
ADDRESSE: McAndrews, Held & Mailoy, Ltd.
STREET: 500 West Madison Street, 34th floor
CITY: Chicago
STATE: Illinois
COUNTRY: USA
ZIP: 60661

S16022
S16022
abrin-c precursor - Indian licorice
N;Contains: rRNA N-glycosidase (EC 3.2.2.2)
C;Species: Abrus precatorius (Indian licorice)
C;Date: 19-Mar-1997 #sequence_revision 19-Mar-1997 #text_change 20-Aug-1999
C;Accession: S16022

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disulphide bonding at an amino acid position corresp. to a position not naturally available for bonding; the cys residue is located in the C-terminal region of the analogue between a position corresp. to amino acid 251 and the C-terminus of ricin A chain. The analogues are pref. joined via a disulphide linkage to a molecule which specifically binds to a target cell, e.g. an antibody fragment. (Updated on 09-JAN-2003 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in-vivo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR63902 is the ricin A chain gene product, it is analogous to the ribosome-inactivating proteins (RIPs) described in AAR63903-R63911. RIPs are the key components of cytotoxic therapeutic agents (CTAs) which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ricin A-chain; Abrin-A A-chain; Saporin; SLT-1; Luffin A; MAP; Ricinus communis agglutinin; Momordin; PAP-S; Luffin-B; Dianthin 30; therapeutic toxin; tumour cell targeted; protein synthesis inhibitor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ricin A-chain ribosome inhibitory protein inactive precursor.

    which are suitable for use as components of cytotoxic
therapeutic agents.

                                                                                                                                                                                                   07-JUN-1995;
                                                                                                                                                                                                                                                          08-JUL-1997

The RIPs can be used in the construction of therapeutic toxins targeted to specific cells such as tumour cells via the attachment of a targeting polypeptide, e.g. a monoclonal antibody. A further use is in HIV therapy (see US4869903). There is interest in expressing RIP recombinantly in host eukaryotic cells, because of the capacity to provide correct post-translational processing. However, RIPs effectively inhibit protein synthesis in eukaryotic cells resulting in cell death. Since the inactive RIP proteins are not cytotoxic to eukaryotic cells, they can be recombinantly expressed in such cells and then converted to active RIP proteins.
                                                                             pro-Ribosome Inactivating Protein; proRIP; peptide linker; cancer; inactivation; eukaryotic ribosome; alpha fragment; beta fragment; inhibitor; protein synthesis; N-glycosidase; glycosidic bond; liverat; ribosomal 28S RNA; cellular proliferation; HIV-infected T cel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAW21698-710 represent Ribosome Inactivating CP Proteins (RIP's), which may be used in the construction of the protein of the invention. The proRIP has a selectively removable, internal peptide linker. The precursor sequence is incapable of inactivating eukaryotic ribosomes, but can be converted by removal of the linker into a protein having alpha and beta fragments and being capable of inactivating eukaryotic ribosomes. RIPs are potent substituted inhibitors of eukaryotic protein synthesis. They possess a highly specific N-glycosidase activity which cleaves the glycosidic bond of adenine 4324 of rat liver ribosomal 28S RNA. RIP's selectively inhibit cellular proliferation of cells, e.g. cancer cells and HIV-infected T cells. The inactive proRIP proteins make it possible to provide protein synthesis inhibitors with uses in practical and improved ways not before possible. The RIP can be used to make cytotoxic conjugates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                               RESULT 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC (AAN70525), putative ricin E (AAN70526) and RCA (AAN70524) in precursor CC (AAN70525), putative ricin E (AAN70525) and RCA (AAN70524) in precursor CC (Form were obtd. using messenger RNA to obtain a cDNA library, and CC then probing the library to retrieve the desired cDNA library, and CC (AAN70520) and RCA (AAN70514. Figure 4 (see CC AAN70520, AAN70521, AAN70522) shows the nucleotide sequences of three CC plasmids contg. cDNA inserts obtd. by probing a cDNA library for CC sequences encoding ricin B using the probe in AAN70517. The cDNA CC inserts can be placed into expression vectors. Site-directed CC mutagenesis may be used to place an AFG start codon and a HindIII CC site at the beginning of the mature protein (see AAN70518). The CC coding sequences of the inserts can be ligated into expression CC (AAN70523) and suitable retroregulators.

CC (AAN70523) and suitable retroregulators.

CC (Updated on 25-MAR-2003 to correct PA field.)
